QUANTORA

THE MARKET, READ CLEARLY.

CONTENT PLAN · 7 DAYS · 10 DELIVERABLES

A week of research, *read clearly.*

A 7-day campaign for Quantora Labs: 3 SaaS motion videos, 4 posts and 3 short articles, each with copy, caption and generation prompt.

WINDOW: TUE 27 OCT – MON 02 NOV 2026 · SOURCES: @QUANTORA_LABS BIO + BANNER SUPPLIED BY THE CLIENT

One idea: *read the market clearly.*

CORE MESSAGE

Quantora Labs does quantitative research for onchain finance, covering tokenized stocks, ETFs and market simulations. Every piece shows the method: *risk, context, evidence*.

RISK

What can go wrong, and how much it would cost: drawdowns, gaps, liquidity.

CONTEXT

Why a move is happening: market hours, flows, events, the asset behind the token.

EVIDENCE

What the data actually supports, tested before it becomes a view.

SIMULATION

Market simulations as a way to stress an idea, never as a forecast.

GOALS

GOAL	HOW	TRACK
Awareness	Intro video + poster, daily X posts	Impressions, follower growth on @Quantora_Labs
Credibility	Method carousel, three articles	Saves, bookmarks, read-through, replies
Site visits	CTA to quantora.buzz in every piece	Link clicks

CONTENT MIX: 10 DELIVERABLES

TYPE	COUNT	FORMAT	STYLE
VIDEO	3	20 s SaaS motion films, 1080p 60 fps + 9:16 cuts	Locked whatships references: Supabase, Krea 3, Conqueror
POST	4	16:9, 4:5, 1:1 and a 5-slide carousel	Quantora banner system (paper, serif, mono, annotated charts)
ARTICLE	3	≈300 words	Calm, precise research voice

Look, voice, *rules.*

PALETTE

- PAPER #ECE8DF
- PAPER DEEP #E2DDD2
- INK #161514
- SOFT #55524C
- FAINT #8F8A80

TYPE & MARKS

Newsreader, *one italic word*

Headlines

QUANTORA

Wordmark (Jost, wide tracking, lookalike)

SPACED MONO LABELS

Annotations, counters

VOICE

Calm, precise, unhurried. Short sentences. One italic word per headline. Phrases to reuse: "The market, read clearly." · "Risk. Context. Evidence." · "Simulations stress ideas. They don't predict prices."

MOTION RULE

Videos follow the locked whatships references only (docs/reference/whatships/STYLE.md), re-skinned in the paper and serif system, at 1080p 60 fps.

ACCURACY & COMPLIANCE

- Only claims from the bio and banner: quantitative research for onchain finance; tokenized stocks, ETFs, market simulations; "The market, read clearly."
- No performance figures, track records, returns, clients, partners or product features until the client confirms them.
- Every chart is **illustrative**, with no tickers or values. Simulations are **never forecasts**.
- Add "Not investment advice." to articles and to any post discussing markets.
- quantora.buzz could not be reviewed (unreachable from the build environment). Share the site copy to sharpen the plan.

What goes out, *when.*

QV1 · *Introducing Quantora Labs*

CHANNELS	X (pinned) · LinkedIn
FORMAT	20 s · 1080p60 (1920×1080) + 9:16 1080×1920 @ 60 fps
STYLE / REF	SUPABASE MIDDLEWARE (locked ref #5)
OBJECTIVE	Introduce the lab in one line: quantitative research for onchain finance.

SHOT LIST

0–1 S	Warm paper canvas. 'Introducing' resolves letter by letter in Newsreader serif.
1–2.5 S	'Introducing' shrinks up; the Quantora mark + spaced QUANTORA wordmark resolve below.
2.5–5 S	Wordmark slides left; a fine annotated line chart (the banner chart) draws in on the right.
5–9 S	'Quantitative research for [tokenized stocks → ETFs → market simulations]': only the last phrase swaps, with a mono label reel on the right.
9–12 S	'...for onchain finance': three labels burst out around the chart: RISK, CONTEXT, EVIDENCE.
12–15 S	The chart in a gentle 3D tilt; dotted guide lines drop to the axis with mono annotation pills (illustrative).
15–18 S	'The market, read clearly.' with the italic accent word.
18–20 S	Mark + wordmark, quantora.buzz typed in mono, then paper fades to white.

AUDIO — Original soft electronic at ≈80 BPM: felt piano, warm sub, ticks on each swap, resolving chord. −16 LUFS.

CAPTION

The market, read clearly.

OBJECTIVE	Educate: the risk / context / evidence method on one chart.

ON-IMAGE COPY

1 'A chart is a claim.' · 2 'RISK: what could this cost?' · 3 'CONTEXT: why is it moving?' · 4 'EVIDENCE: what does the data support?' · 5 'The market, read clearly.'

CAPTION

A chart is a claim. Here's how we read one 🧵

Risk → Context → Evidence.

IMAGE GENERATION PROMPT

```
Five-slide 4:5 carousel on warm textured paper. Each
slide: a large serif headline with one italic word,
a fine black line chart on a dotted grid with one
dotted guide highlighted and labelled in tiny spaced
mono caps, a slide counter '0X / 05' top right, thin
footer rule with 'QUANTORA' wordmark. Monochrome
black ink, editorial.
```

All charts illustrative, with no tickers or values.

QA1 · *Reading the market clearly: risk, context, evidence*

CHANNELS	X Article · Medium · LinkedIn
FORMAT	≈300 words · header 16:9
STYLE / REF	Article
OBJECTIVE	Anchor post explaining the lab's reading method.

DRAFT

Reading the market clearly: risk, context, evidence

Every chart is a claim about the world. A line goes up and someone calls it momentum; it goes down and someone calls it a breakdown. Before treating any move as a signal, we ask three questions.

Risk: what could this cost? Not just how far price could fall, but how fast, and whether you could act in time. Drawdowns, overnight gaps and thin liquidity all belong here.

Context: why is it moving? Onchain markets now include tokenized stocks and ETFs, whose prices depend on an underlying market with its own hours, events and flows. A move during a closed session means something different from the same move at the open.

Evidence: what does the data actually support? A pattern you can see once is a story. A pattern that survives testing across many periods and conditions starts to become evidence.

We use market simulations to bridge the last two: run an idea across many plausible paths and see where it breaks. Simulations don't predict prices; they show how fragile a view is.

That's the whole method. Risk, context, evidence. The market, read clearly.

NOT INVESTMENT ADVICE.

CAPTION

New: how we read a chart before calling it a signal.

Risk → Context → Evidence ↓

WRITING PROMPT

```
Write a ~300-word article 'Reading the market
clearly: risk, context, evidence' in a calm, precise
research voice. Explain each lens with onchain-
finance examples (tokenized stocks, ETFs), and the
role of market simulations as stress tests, not
forecasts. End with 'The market, read clearly.' No
performance claims.
```

> *Add 'Not investment advice.'*

QV2 · *Risk. Context. Evidence.*

CHANNELS	X · LinkedIn
FORMAT	20 s · 1080p60 (1920×1080)
STYLE / REF	KREA 3 (locked ref #1)
OBJECTIVE	Show the lab's reading method: the three annotations from the banner.

SHOT LIST

0–2 S	'Read' assembled from mismatched editorial letters (serif, mono, outline, italic), with floating chart fragments. The letters snap into clean Newsreader.
2–5 S	'Every move has a story.' reflows up; 'Read it clearly.' types below. A fine line chart draws across a dotted grid.
5–8 S	A cursor drops a guide line on the first peak: the pill 'RISK' grows big, then shrinks to an annotation.
8–11 S	A dashed line runs to the trough: 'CONTEXT'. A small mono note reads 'market closed · gap' (illustrative).
11–14 S	The chart climbs; 'EVIDENCE' pins to the high point, and a shaded region fills under the line.
14–17 S	A clean card in the leaderboard style: Risk / Context / Evidence rows, each highlighted in turn with the cursor.
17–20 S	'The market, read clearly.' then the mark + wordmark.

AUDIO — Original light electronic at ≈118 BPM: sparse intro, groove from 2 s. −15 LUFS.

CAPTION

Risk. Context. Evidence.

Three questions we ask of every move before calling it a signal.

The market, read clearly. · quantora.buzz

BUILD PROMPT (CLAUDE + CLAUDEMOTION REPO)

```
In claudemotion, build 'QuantoraMethod' (20 s,
1920×1080, 60 fps) recreating the locked Krea 3
reference (ANALYSIS.md §1) in Quantora's editorial
paper style: a ransom-note title that snaps clean, a
reflowing headline over a drawing chart, a cursor
dropping guide lines, pill → annotation morphs
(RISK, CONTEXT, EVIDENCE), a region fill, a
leaderboard-style card. Illustrative chart, no
values.
```

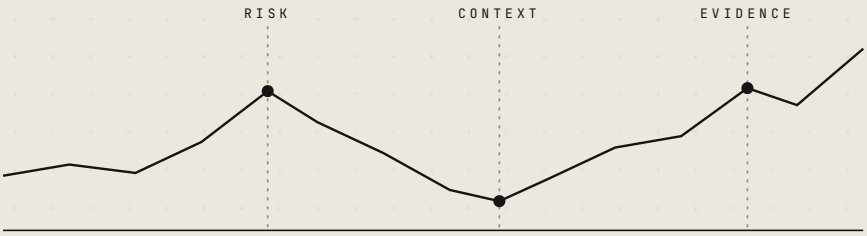

> *The annotations mirror the banner. No numbers.*

QP3 · *Tokenized stocks vs ETFs: what to watch*

CHANNELS	X · LinkedIn
FORMAT	4:5 2160×2700
STYLE / REF	Static · comparison
OBJECTIVE	Educational comparison tied to the lab's coverage areas.

ON-IMAGE COPY

TOKENIZED STOCKS · ETFs · Two instruments, one question: what moves the price you see onchain? · Watch: underlying market hours · liquidity · how the price reaches the chain

CAPTION

Tokenized stocks and ETFs both bring traditional markets onchain.

Before reading either, check three things: underlying market hours, liquidity, and how the price reaches the chain.

IMAGE GENERATION PROMPT

```
4:5 editorial comparison card on warm paper: two
columns 'Tokenized stocks' and 'ETFs' in serif, thin
vertical rule between, three shared checklist rows
in spaced mono caps beneath (MARKET HOURS ·
LIQUIDITY · PRICE SOURCE), small annotated chart
glyphs, Quantora wordmark footer.
```

Keep it generic and factual. No claims about specific products or issuers.

QA2 · *Tokenized stocks and ETFs onchain: what to measure*

CHANNELS	Blog · X Article
FORMAT	≈300 words · header 16:9
STYLE / REF	Article
OBJECTIVE	Coverage-area explainer (SEO: tokenized stocks, ETFs).

DRAFT

Tokenized stocks and ETFs onchain: what to measure

Tokenized stocks and ETFs bring familiar instruments onto public blockchains. They look like any other token in a wallet, but the price you see onchain is tied to something that lives elsewhere.

That makes measurement different. Three things matter before any analysis.

Underlying market hours. The token may trade around the clock while the reference market sleeps. Moves during closed hours can rest on thin information and be repriced at the next open.

Liquidity. Onchain depth for a tokenized instrument can differ a lot from the depth of the underlying. Spreads and slippage change what a price actually means for someone trying to act on it.

How the price reaches the chain. Whether through issuers, market makers or oracles, every route adds timing and structure that a careful reader should know.

Our research focuses on these instruments and uses market simulations to stress assumptions about each of them. The goal isn't a price call; it's a clearer picture of what the numbers can and can't tell you.

NOT INVESTMENT ADVICE.

CAPTION

Tokenized stocks and ETFs onchain look like any token. They don't behave like one.

Three things to measure first ↓

WRITING PROMPT

```
Write a ~300-word explainer 'Tokenized stocks and
ETFs onchain: what to measure' covering market
hours, liquidity and price routes (issuers, market
makers, oracles) in general terms. No specific
products, issuers or numbers. Calm research voice;
close on simulations as stress tests.
```

> *Keep it product-agnostic. Add 'Not investment advice.'*

QV3 · *Your thesis is… tested*

CHANNELS	X · Instagram Reels · TikTok
FORMAT	20 s · 1080p60 (1920×1080) + 9:16 1080×1920 @ 60 fps
STYLE / REF	CONQUEROR (locked ref #3)
OBJECTIVE	Make 'market simulations' tangible: stress an idea before trusting it.

SHOT LIST

0–3 S	'Introducing Quantora for [tokenized stocks → ETFs → onchain markets]': small serif text in crop marks over a soft paper-grey ink blob.
3–4 S	Pixel-dissolve transition into a paper halftone with a huge spaced QUANTORA wordmark.
4–7 S	'Start with a question' + a frosted input: 'What if the market gaps 10% overnight?' types, then an extreme zoom into the caret and pull back.
7–13 S	White canvas. 'Your thesis is… a hunch / a chart / simulated / evidence.' A vignette above each: a question mark, a line chart, a fan of simulated paths, an annotated chart.
13–17 S	A monitor mockup showing a fan chart of simulated paths (illustrative) with percentile bands.
17–19 S	'Simulations stress ideas. They don't predict prices.'
19–20 S	Black: mark + quantora.buzz typed with a caret.

AUDIO — Original electronic at ≈124 BPM with a drop at 7 s. −16 LUFS.

CAPTION

Your thesis is… a hunch, until it's tested.

We run market simulations to stress an idea before it becomes a view.
Simulations stress ideas. They don't predict prices.

quantora.buzz

BUILD PROMPT (CLAUDE + CLAUDEMOTION REPO)

```
In claudemotion, build 'QuantoraThesis' (20 s,
1920×1080 + 1080×1920, 60 fps) recreating the locked
Conqueror reference (ANALYSIS.md §3) in Quantora
style: NameCycler in crop marks, PixelDissolve into
a paper halftone, ExtremeZoomInput, PhraseSwap 'Your
thesis is…', a monitor mockup with an illustrative
fan chart. Original 124 BPM score.
```

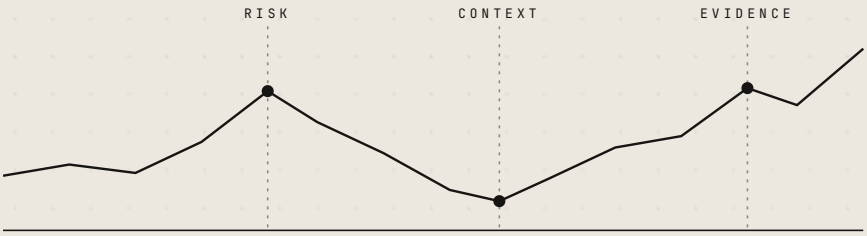

> *Never imply forecasts or returns. Fan charts are labelled ILLUSTRATIVE SIMULATION.*

QP4 · *What a market simulation is (and isn't)*

CHANNELS	X · LinkedIn · Instagram
FORMAT	1:1 2160×2160
STYLE / REF	Static · statement
OBJECTIVE	Set expectations: simulations are for stress-testing, not prediction.

ON-IMAGE COPY

A SIMULATION IS: a stress test · a range of outcomes · a way to ask 'what if?' / A SIMULATION ISN'T: a forecast · a price target · advice

CAPTION

Market simulations, explained in one image.

They stress an idea across many paths. They don't tell you where price goes.

IMAGE GENERATION PROMPT

```
Square editorial card on warm paper: a fan of thin
black simulated price paths spreading from one
point, with a shaded percentile band. Two short
lists in serif: 'is' (stress test, range of
outcomes, what-if) and 'isn't' (forecast, price
target, advice). Tiny 'ILLUSTRATIVE SIMULATION'
label in spaced mono.
```

> *Must keep the 'isn't advice / forecast' framing.*

QA3 · *Why we simulate markets before forming a view*

CHANNELS	Blog · LinkedIn · X Article
FORMAT	≈280 words · founder/research voice
STYLE / REF	Article
OBJECTIVE	Close the week on the lab's core practice.

DRAFT

Why we simulate markets before forming a view

A single price history is one path out of many that could have happened. Treat it as the only one, and every pattern looks more reliable than it is.

Market simulation starts from that humility. Instead of asking 'what happened?', it asks 'what could have happened, and how would this idea have done across all of it?'

For tokenized stocks and ETFs onchain, that means building paths that respect how these instruments actually behave: sessions that open and close, gaps between them, liquidity that thins, prices that arrive on-chain with a delay.

Run an idea through thousands of those paths and you learn its shape: where it holds up, where it breaks, how wide the range of outcomes is. That range is the honest answer, not a single number.

What simulations are not: forecasts, price targets or advice. They stress ideas; they don't predict markets.

That's why we simulate first. The market, read clearly.

NOT INVESTMENT ADVICE.

CAPTION

One price history is one path out of many.

Why we simulate markets before forming a view ↓

WRITING PROMPT

```
Write a ~280-word piece 'Why we simulate markets
before forming a view': one path vs many, building
realistic paths for tokenized stocks/ETFs (sessions,
gaps, liquidity, price delays), learning an idea's
shape, and an explicit 'what simulations are not'
paragraph. Calm, honest research voice.
```

Add 'Not investment advice.'

How to *make it.*

VIDEOS

Built in the claudemotion repo with Remotion, recreating the locked whatships references shot for shot, at 1080p 60 fps plus 9:16 cuts. Original music. Charts labelled ILLUSTRATIVE; simulations labelled ILLUSTRATIVE SIMULATION.

POSTS
